Your Peptide Protocol Guide

BPC-157 + Thymosin Beta-4

Everything you need to know about your peptide therapy — how it works, how to inject, and what to expect as you heal.

BPC-157: 500 mcg

Thymosin Beta-4: 500 mcg

THE BASICS

What Are Peptides?

Peptides are short chains of amino acids — the building blocks of proteins. They act as natural signals in your body, telling your cells what to do and when to do it.

Unlike many medicines that force change, peptides support your body's own healing and recovery processes. Think of them as a boost to what your body already knows how to do.

YOUR BLEND

BPC-157 + Thymosin Beta-4

Two peptides that work together to support recovery from different angles.

🧬 BPC-157

Body Protection Compound — found naturally in the stomach and known for its tissue repair properties.

- ✔ Supports tendon, ligament, and muscle repair
- ✔ Improves blood flow to injured tissue
- ✔ May accelerate wound healing

⚡ Thymosin Beta-4

A naturally occurring peptide involved in tissue regeneration and repair throughout the body.

- ✔ Promotes new blood vessel growth
- ✔ Supports cell migration and repair
- ✔ Reduces inflammation

Why Together?

BPC-157 focuses on direct tissue repair while Thymosin Beta-4 improves blood flow and reduces inflammation. Together, they address recovery from multiple angles — one speeds healing, the other creates the environment for it.

PROTOCOLS

Choose Your Protocol

Pre-filled, single-use syringes delivered to your door. One injection per day.

BEST VALUE

20-DAY

$450

Extended healing for moderate injuries. Builds on initial progress with continued support.

10-DAY

$250

Starter protocol for recent injuries, flare-ups, or first-time users. Many notice improvement within this window.

30-DAY

$675

Advanced protocol for chronic issues, post-surgery recovery, or athletes in training.

INSTRUCTIONS

How to Use Your Injections

We did your first injection together at the clinic. Here's how to stay on track at home.

1. **Prep**

   Wash your hands. Clean the injection site with an alcohol pad. Take the syringe out of the fridge a few minutes early to let it reach room temperature.

2. **Inject**

   Inject just under the skin (subcutaneous) into a fatty area — lower abdomen, upper thigh, or back of the arm. Pinch the skin, insert at a 45° angle, inject slowly.

3. **Rotate Sites**

   Don't inject in the same spot every day. Rotate between your abdomen, thighs, and arms to prevent irritation and ensure consistent absorption.

4. **Dispose Safely**

   Each syringe is single-use — do not reuse or recap. Dispose in a sharps container or bring used syringes back to the clinic.

> 💡 **Pro Tips**
>
> Keep syringes refrigerated. Set a daily phone reminder to stay consistent — same time every day (morning or evening) keeps peptide levels stable and maximizes healing. Mild redness at the injection site is normal and should fade quickly.

TIMELINE

What to Expect

Everyone's different, but here's what patients typically experience.

Days 1–10

Reduced swelling and inflammation. Improved mobility. Many notice less pain during daily activities.

Days 10–30

Deeper healing. Continued tissue repair. Consistency compounds — the longer you stay on protocol, the more benefit you build.

SAFETY

Important Safety Information

Do Not Use If You Are:

- ✕ Pregnant or breastfeeding
- ✕ Living with active cancer
- ✕ Managing serious liver, kidney, or heart conditions
- ✕ Dealing with uncontrolled medical conditions
- ✕ Allergic to any ingredient

Possible Side Effects:

- Mild redness, swelling, or itching at injection site
- Slight headache or fatigue
- Occasional nausea or lightheadedness

Usually mild and short-lived. If symptoms are moderate or severe, stop use and contact us.

Important: Peptides are classified for research purposes only and are not FDA-approved to diagnose, treat, cure, or prevent any disease. Handle and store as instructed. Individual results vary based on health status, dosage, and consistency.
