

HORMONE OPTIMIZATION PROGRAM

Your Roadmap

PATIENT INFORMATION

Patient _____ Date _____
Provider _____ Primary Goal _____

Your program has three phases: **find your dose, stabilize and fine-tune**, and **maintain your results long-term**. Hormone optimization is not a quick fix — it's a process, and each phase has a purpose.

YOUR THREE PHASES

1

Reset & Find Your Dose

First 8–12 weeks

"This phase is about finding your sweet spot, not perfection on day one."

- Baseline labs and comprehensive symptom review
- Start or adjust hormones based on your labs and goals
- First follow-up labs around week 8 to see how your body responds
- Regular check-ins to monitor symptoms and adjust
- **What you're tracking:** energy, mood, sleep, libido, any side effects

2

Stabilize & Fine-Tune

Next 3–6 months

"Do most days feel better than before we started?"

- Keep your levels in a stable, optimal range
- Small dose adjustments if labs or symptoms call for it
- Provider visits every 8–12 weeks with labs at the same rhythm
- Address any secondary factors — sleep, stress, nutrition, training

3

Maintain & Monitor

Ongoing

- Move to a steady maintenance schedule
- Labs every 3–6+ months as clinically appropriate
- Check-ins to adjust for life changes — stress, weight, other health shifts
- Transition into **Range Continued Care Membership** for ongoing labs, follow-ups, and easier access to adjustments

UPCOMING DATES

Next Visit _____ Next Labs _____

WHAT TO EXPECT

Weeks 1–4	Early changes in energy and sleep. Full hormone response takes 6–8 weeks.
Weeks 6–12	Meaningful improvement in mood, body composition, libido, and recovery. Follow-up labs confirm we're on track.
Month 3+	Compounding benefits. This is when patients say they feel like themselves again.
