

LAB PANELS GUIDE

What we test, what it means, and why it matters

ESSENTIAL PANEL

Essential Panel

\$350

Our foundational panel covers hormones, thyroid, metabolic health, and key vitamins. Goes beyond standard annual bloodwork — gives you the full baseline.

55 biomarkers (men) • 57 biomarkers (women)

Men’s Essential Panel

BIOMARKER	WHAT IT TELLS US
Complete Metabolic Panel (CMP)	Kidney function, liver enzymes, blood sugar, electrolytes, and proteins — 17 markers in one panel.
Lipid Panel	Total cholesterol, HDL, LDL, triglycerides, and ratios — cardiovascular risk assessment.
CBC with Differential	Red cells, white cells, platelets — detects anemia, infection, and immune issues. 20 markers.
Estradiol	Primary estrogen. In men, high levels cause fatigue and weight gain. In women, key for reproductive health.
HbA1c	Average blood sugar over 3 months — the gold standard for detecting pre-diabetes.
Insulin, Fasting	Reveals metabolic dysfunction early, before blood sugar goes abnormal.
PSA, Total	Prostate-specific antigen — important for monitoring prostate health. (Men only)
SHBG	Sex hormone binding globulin — affects how much testosterone is available to your body.
T3, Free	The active thyroid hormone. Low T3 causes fatigue and brain fog even when TSH looks normal.
T4, Total	Main thyroid hormone your body converts to T3. Assesses overall thyroid output.
Testosterone, Free	The testosterone actually available for your body to use.

Testosterone, Total	Overall testosterone production. Low levels cause fatigue, low libido, and muscle loss.
TPO Antibodies	Detects autoimmune thyroid disease (Hashimoto's) — often elevated years before symptoms.
TSH	Thyroid-stimulating hormone — the first-line thyroid screening marker.
Vitamin D, 25-OH	Critical for immune function, mood, bone health, and hormones. Most people are deficient.

Women's Essential Panel

Includes everything in the men's panel (except PSA) plus FSH, LH, and Progesterone.

- ✓ **FSH** — Follicle-stimulating hormone — assesses fertility, menopause status, and pituitary function.
- ✓ **LH** — Luteinizing hormone — works with FSH to regulate reproductive function.
- ✓ **Progesterone** — Balances estrogen; supports mood, sleep, and reproductive health. (Women only)

Lab panels are ordered by your Range Medical provider based on your health goals. Results are reviewed during your follow-up appointment.

ELITE PANEL

Elite Panel

\$750

Everything in the Essential Panel plus advanced cardiovascular, inflammation, and longevity markers. The most comprehensive panel we offer — includes markers many clinics skip entirely.

78 biomarkers (men and women)

Includes all Essential Panel markers, plus the following:

Additional Men's Elite Markers

BIOMARKER	WHAT IT TELLS US
Apolipoprotein A-1	The protein in 'good' HDL cholesterol. Higher levels are protective against heart disease.
Apolipoprotein B	The protein in 'bad' LDL particles — a better predictor of heart disease than standard cholesterol.
CRP-HS (Inflammation)	High-sensitivity inflammation marker — elevated in heart disease and chronic illness.
Cortisol	Primary stress hormone. Chronic high or low cortisol affects energy, sleep, and weight.
DHEA-S	Precursor hormone that declines with age. Supports energy, mood, and immune function.
Ferritin	Iron storage protein. Low ferritin causes fatigue even when iron looks normal.
Folate	Essential B-vitamin for DNA synthesis. Low levels linked to fatigue and heart disease.
FSH	Follicle-stimulating hormone — assesses fertility, menopause status, and pituitary function.
GGT	Sensitive liver enzyme — elevated early in liver stress or bile duct issues.
Homocysteine	Amino acid linked to heart disease and stroke when elevated. Also indicates B-vitamin status.
IGF-1	Reflects growth hormone status — important for metabolism, muscle, and longevity.
Iron & TIBC	Serum iron, total iron binding capacity, and transferrin saturation — diagnoses anemia and overload.
LH	Luteinizing hormone — works with FSH to regulate reproductive function.

Lipoprotein(a)	Genetic cardiovascular risk factor — high Lp(a) significantly increases heart attack risk.
Magnesium	Essential mineral for 300+ functions. Deficiency causes cramps, anxiety, and sleep issues.
PSA, Free & Total	Detailed prostate screening — free-to-total ratio distinguishes cancer from benign conditions. (Men only)
Sed Rate	Erythrocyte sedimentation rate — measures inflammation in autoimmune conditions.
T4, Free	Unbound, active form of T4 — more accurate than total T4 for thyroid assessment.
Thyroglobulin Antibodies	Another marker for autoimmune thyroid disease, tested alongside TPO antibodies.
Uric Acid	High levels cause gout and are linked to metabolic syndrome and kidney stones.
Vitamin B-12	Essential for energy, nerve function, and red blood cells. Deficiency is common and often missed.

Additional Women's Elite Markers

*Same as men's Elite extras (above), except replaces PSA with: **DHT**.*

ADD-ON PANELS

Add-on panels can be ordered alongside any Essential or Elite blood draw. These are specialty tests that go beyond routine bloodwork to screen for heavy metal exposure and mold sensitivity.

Heavy Metals Panel — Blood (3 Toxic) \$220

Whole Blood • ICP-MS/MS

Screens for the three most common toxic heavy metals. Ideal for patients with occupational exposure, contaminated water concerns, or unexplained symptoms like fatigue, headaches, or cognitive issues.

METAL	WHY WE TEST IT
Arsenic	Found in contaminated water, rice, and seafood. Chronic exposure linked to cancer, cardiovascular disease, and neurological damage.
Lead	From old paint, pipes, and occupational exposure. Causes cognitive decline, kidney damage, and hypertension — no safe level.
Mercury	Primarily from fish consumption and dental amalgams. Affects nervous system, kidneys, and immune function.

No special preparation required — collected during your regular blood draw.

Heavy Metals Panel — Urine (21 Toxic) \$280

Urine Collection • ICP-MS/MS

The most comprehensive toxic metals screen we offer. Tests 21 metals via urine to evaluate cumulative exposure and detoxification status. Recommended for patients concerned about environmental toxins, those undergoing chelation, or anyone with chronic unexplained symptoms.

METALS TESTED (21)		
✓ Aluminum	✓ Gadolinium	✓ Rubidium
✓ Arsenic	✓ Germanium	✓ Thallium
✓ Antimony	✓ Lead	✓ Thorium
✓ Barium	✓ Mercury	✓ Tin
✓ Bismuth	✓ Nickel	✓ Titanium
✓ Cadmium	✓ Niobium	✓ Tungsten
✓ Cesium	✓ Platinum	✓ Uranium
✓ Creatinine (Random Urine)		

Preparation: Avoid seafood for 48 hours before collection. Specimen must be collected in an acid-washed or metal-free plastic container.

Mold Profile Plus IgE

\$200

Blood Draw • Immunoassay

Screens for IgE-mediated allergic sensitivity to six common indoor molds. Ideal for patients with chronic sinus issues, unexplained respiratory symptoms, persistent fatigue, or known mold exposure at home or work.

MOLD SPECIES	COMMON NAME / WHERE IT'S FOUND
Penicillium Notatum (m1)	Blue-green mold found on food, wallpaper, and damp buildings. One of the most common indoor molds.
Cladosporium herbarum (m2)	Found on plants, textiles, and window frames. The most common outdoor mold, also thrives indoors.
Aspergillus fumigatus (m3)	Found in soil, compost, and HVAC systems. Can cause serious lung infections in susceptible individuals.
Mucor racemosus (m4)	Fast-growing mold found in dust, soil, and decaying food. Common in older buildings.
Alternaria alternata (m6)	Found in showers, window frames, and damp areas. A major trigger for allergic asthma.
Stemphylium Botryosum (m10)	Found on decaying plants and in agricultural settings. Less common but clinically significant.

No special preparation required — collected during your regular blood draw.
